

Measured E_k (series 1): which clock $t \tilde{a}^p$ makes the three values of a agree in the UV?

spread between a / measurement error (variance ratio)

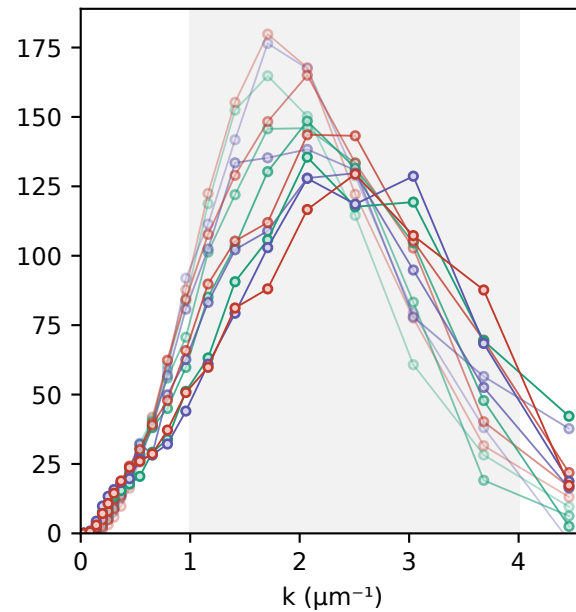

$p_{UV} = 1.20 \pm 0.04$

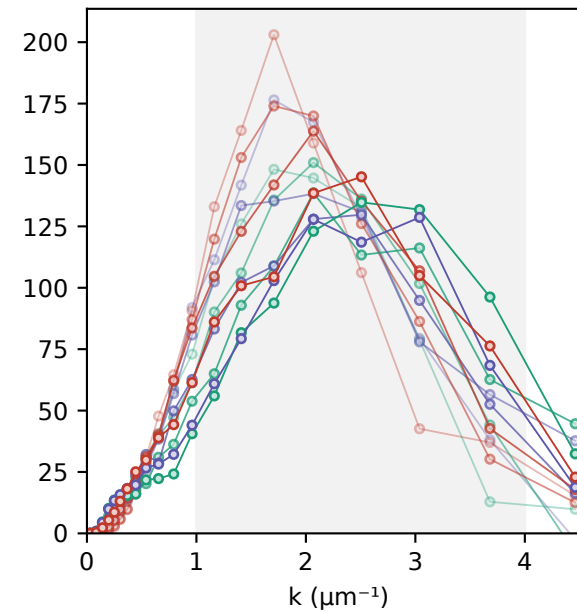

$p = 0$: same t

$p = 1.20$: best

$p = 2$: kinetic, $t \tilde{a}^2$

$a = 150 a_0$
 $a = 300 a_0$
 $a = 600 a_0$
 faint $\rightarrow$ dark: $\tau = t \tilde{a}^p = 20, 40, 80, 160$ ms
 grey band: k range of the fit
